

AMENDMENTS TO THE CLAIMS

Claims remaining in the application are as follows:

1. (Currently Amended): An electronic system comprising:
an enclosure; and
a backplane coupled inside the enclosure and comprising a plurality of slots, each slot
configured to interchangeably receive a plurality of modules module selected
from among a plurality of modules including multiple different power modules
and multiple different function modules module types that perform different
functions, the individual modules of the module plurality being adapted for
plug insertion into backplane slots, the backplane receiving power and signal
connections from external to the enclosure via at least one of the modules
rather than internal cabling.
2. (Original): The electronic system according to Claim 1 further comprising:
a plenum airspace including an input plenum and an output plenum.
3. (Previously presented): The electronic system according to Claim 2 further
comprising:
at least one cooling module plug-inserted into a backplane slot adjacent to the plenum
airspace and adapted to move air through the plenum airspace.
4. (Currently Amended): The electronic system according to Claim 2 further
comprising:
at least one module ~~including~~ selected from among power modules and function
modules that are interchangeably plug-inserted into any slot of at least one
backplane slot, and forming an unobstructed airway between the input plenum
and the output plenum.

5. (Currently Amended): The electronic system according to Claim 1 further comprising:

at least one module ~~including~~ selected from among power modules and function modules having a substantially common height and depth and being an integral number of slots wide to enable a variable number and type of module to be inserted within the enclosure, the power modules and function modules being configured for interchangeable plug insertion into the same backplane slots.

6. (Previously presented): The electronic system according to Claim 5 further comprising:

at least one power module plug inserted into at least one backplane slot and having a power inlet for receiving system power in a configuration for alternating current (AC) power and direct current (DC) power, the at least one power module having a height and depth substantially common with the height and depth of function modules and being adapted for interchangeable plug insertion into backplane slots in common with function modules.

7. (Previously presented): The electronic system according to Claim 5 further comprising:

at least one display and control module plug inserted into at least one backplane slot and comprising a user interface for display and input functionality, the at least one display and control module having a height and depth substantially common with the height and depth of function modules and being adapted for interchangeable plug insertion into backplane slots in common with other function modules and power modules.

8. (Previously presented): The electronic system according to Claim 1 further comprising:

at least one function module plug interchangeably inserted into at least one backplane slot, the function modules being selected from among a group comprising graphics modules, input/output (I/O) modules, Uninterrupted Power Supply (UPS) modules, storage modules, server modules, switch modules, processor

modules, memory modules, and combinational modules combining functionality of a plurality of function modules.

9. (Currently Amended): An electronic system comprising:
an enclosure; and

a backplane comprising opposing first and second planar sides, the backplane intersecting the enclosure and comprising a plurality of slots on both the first and second planar sides, each slot configured to interchangeably receive a plurality of modules module selected from among a plurality of modules including multiple different power modules and multiple different function module types and adapted to perform multiple different functionalities, the backplane receiving power and signal connections from external to the enclosure via at least one of the modules rather than internal cabling.

10. (Currently Amended): The electronic system according to Claim 9 wherein: the modules include power modules and function modules with substantially common height and depth and being an integral number of slots wide whereby the modules can be interchangeably inserted into the same slot of at least one backplane slot.

11. (Original): The electronic system according to Claim 9 further comprising: a first plenum airspace on a first end of the backplane and a second plenum airspace on a second end of the backplane, the first plenum including an input plenum and an output plenum so that cooling air circulates from the input plenum through modules on the first side of the backplane, through the second plenum, through modules on the second side of the backplane, and to the output plenum.

12. (Previously presented): The electronic system according to Claim 10 further comprising:

at least one cooling module plug-inserted into a backplane slot of the plurality of backplane slots adjacent to the first plenum airspace and adapted to move air through the plenum airspace.

13. (Currently Amended): The electronic system according to Claim 9 further comprising:

a plurality of modules including power modules and function modules arranged in slots inserted into the first and second sides of the backplane, and having an unobstructed airway between the input plenum and the output plenum, the power modules and function modules being configured for interchangeable plug insertion into the same slot of a plurality of backplane slots.

14. (Previously presented): The electronic system according to Claim 9 further comprising:

at least one power module plug inserted into at least one backplane slot and having a power inlet for receiving system power in a configuration for alternating current (AC) power and direct current (DC) power, the at least one power module having a height and depth substantially common with the height and depth of function modules and being adapted for interchangeable plug insertion into backplane slots in common with the function modules.

15. (Original): The electronic system according to Claim 9 further comprising: at least one display and control module plug inserted into at least one backplane slot and comprising a user interface for display and input functionality, the at least one display and control module having a height and depth substantially common with the height and depth of function modules.

16. (Previously presented): The electronic system according to Claim 9 further comprising:

at least one function module plug interchangeably inserted into at least one backplane slot, the function modules being selected from among a group comprising graphics modules, input/output (I/O) modules, Uninterrupted Power Supply (UPS) modules, storage modules, server modules, switch modules, processor modules, memory modules, and combinational modules combining functionality of a plurality of function modules.

17. (Currently Amended): An electronic system comprising:
an enclosure;

a backplane comprising opposing first and second planar sides, the backplane intersecting the enclosure and comprising a plurality of slots on both the first and second planar sides, each slot configured to interchangeably receive a plurality of modules module selected from among a plurality of modules including power modules and multiple different function module types that perform different functions, the backplane receiving power and signal connections from external to the enclosure via the modules rather than internal cabling; and

a first plenum airspace on a first end of the backplane and a second plenum airspace on a second end of the backplane, the first plenum including an input plenum and an output plenum so that cooling air circulates from the input plenum through modules on the first side of the backplane, through the second plenum, through modules on the second side of the backplane, and to the output plenum.

18. (Previously presented): The electronic system according to Claim 17 further comprising:

at least one cooling module plug-inserted into a backplane slot adjacent to the first plenum airspace and adapted to move air through the plenum airspace.

19. (Currently Amended): The electronic system according to Claim 17 further comprising:

first and second cooling modules plug inserted into respective first side and second side backplane slots adjacent to the input plenum and the output plenum, respectively, and arranged in a push-pull configuration, the first and second cooling modules being identical and the second cooling module plug-inserted in an inverted arrangement relative to the first cooling module whereby the first cooling module pushes air and the second cooling module pulls air through the electronic system.

20. (Previously presented): The electronic system according to Claim 17 further comprising:

a plurality of modules including power modules and function modules interchangeably arranged in slots inserted into the first and second sides of the backplane, the modules further comprising:
an unobstructed airway between the input plenum and the output plenum; and
at least one status light-emitting diode (LED) coupled a display panel on the enclosure adjacent the module.

21. (Previously presented): The electronic system according to Claim 17 further comprising:

at least one power module plug inserted into at least one backplane slot and having a power inlet for receiving system power in a configuration for alternating current (AC) power and direct current (DC) power, the at least one power module having a height and depth substantially common with the height and depth of function modules, and configured for interchangeable insertion into backplane slots in common with the function modules.

22. (Previously presented): The electronic system according to Claim 17 further comprising:

at least one display and control module plug inserted into at least one backplane slot and comprising a user interface for display and input functionality, the at least

one display and control module having a height and depth substantially common with the height and depth of function modules and adapted for interchangeable insertion into one or more backplane slots in common with the function modules.

23. (Previously presented): The electronic system according to Claim 17 further comprising:

at least one function module plug interchangeably inserted into at least one backplane slot, the function modules being selected from among a group comprising graphics modules, input/output (I/O) modules, Uninterrupted Power Supply (UPS) modules, storage modules, server modules, switch modules, processor modules, memory modules, and combinational modules combining functionality of a plurality of function modules.

24. (Previously presented): An electronic system comprising:

means for enclosing a plurality of electronics components;

multiple means for electronically performing a function, ones of the multiple

performing means being adapted to perform functions selected from among a plurality of types and functions, the multiple performing means having a substantially common height and depth, and being an integral number of slots wide, enabling construction of a wide range of system configurations in terms of module function types and module function redundancy from a single set of modules and a single enclosure;

means for interchangeably inserting and holding the multiple performing means, the inserting and holding means intersecting the enclosing means and being supplied with power and signal connections via the multiple function performing means rather than cabling; and

means for cooling interior to the enclosing means by circulating air around the inserting and holding means and through the multiple performing means.
